

ONVIEW™ CD-ROM DELIVERY

OnView CD-ROM Delivery allows financial institutions to deliver images of paid items, past deposits and statements to their business clients for each accounting period. An efficient, cost-effective, electronic replacement for check storage and paper statements helps simplify operations for business clients, while providing the information they need for proof of payment, research and account reconciliation right at their fingertips.

Images of the front and back of checks and deposit tickets are stored on a CD-ROM, and items are easily accessible using the application's flexible query tool. Information from multiple accounts can be stored on a single CD-ROM to facilitate data retrieval. Business clients can quickly research and view images using multiple search criteria such as item data, dates and other search values. CD-ROMs should be an important part of your business clients disaster recovery plan, as this information can be stored securely offsite and is accessible if needed.

OnView CD-ROM Delivery allows business clients to replace cumbersome paper processes and reduce costs of storage and research.

ONVIEW CD-ROM DELIVERY APPLICATION HAS TWO COMPONENTS:

- CD Builder
- CD Viewer

CD BUILDER

The CD Builder application creates CDs or DVDs that are then delivered to business clients. These CDs contain information from the specified accounts. The financial institution can set up the type of information to include and establish schedules for compiling the information and building the CDs.

The CD Builder application is used to perform the following tasks:

- Set up customer information
- Set up frequency schedules for creating the CDs or DVDs
- Create a CD or DVD
- Preview the item data before the CD is created to eliminate errors.
- Run reports

CD VIEWER

The CD viewer is included on each CD or DVD provided to the business clients. Business clients use the CD Viewer application to review all data on the CD or DVD, which includes images of the items and the statements file for each account.

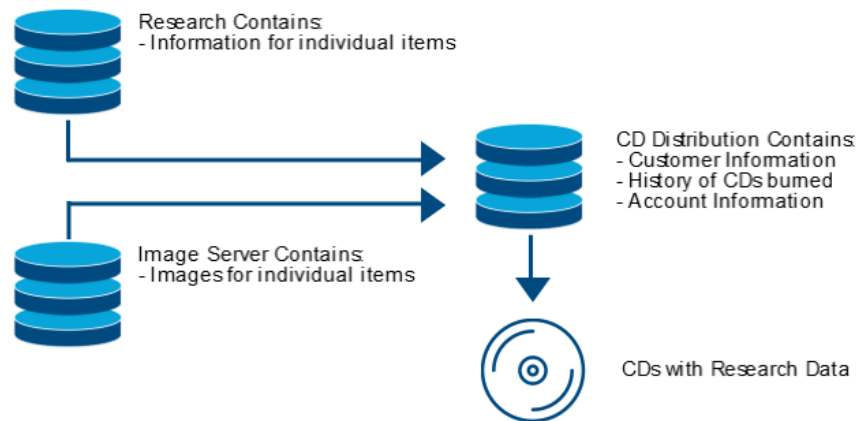

The CD Viewer application is used to perform the following tasks:

- Display the statement data
- Perform research on items
- Conduct queries by date or range of dates
- Save or print an item image
- Export images to Microsoft Word or Excel

HOW IT WORKS

OnView CD-ROM Delivery uses "lights out" process for burning CD-ROMs using Rimage. The solution can obtain data in two different ways: research data and statement data. The following diagrams illustrate the process for creating CDs or DVDs.

CD-ROM WORKFLOW: RESEARCH DATA

CD-ROM WORKFLOW: STATEMENT DATA
